

## **Reset “Default” Camera Settings**

One should always reset the “default” settings on our cameras after we have changed a setting for a particular situation. The “default” settings are those settings that we use most often. They could be full manual, program, aperture or shutter preferred, ISO and white balance settings, etc. The actual settings are up to the individual photographer, but how many times have we changed an ISO to a high value for a low light shot and then go outside and ruin a shot because it is over exposed? How often have we changed to manual focus and then shoot a whole set of photos that are all out of focus? If you keep your “default” settings in mind, you can avoid a lot of angst later.
